## **PATOLOGIE RARE IN ONCOLOGIA**

### **“TUMORI RARI”:**

E' POSSIBILE GUARIRE DA UN TUMORE DEL SANGUE CON LA  
TERAPIA FARMACOLOGICA ORALE:  
“IL CASO” DELLA LEUCEMIA MIELOIDE CRONICA

# Chronic Myelogenous Leukemia

- Rare disease:  
**1-2 cases per year every 100.000 inhabitants**
- Typical hematological picture

- Association with a specific cytogenetic abnormality:  
**the Philadelphia (Ph)-chromosome**

# CML – Chronic Phase

## Clinical Presentation

Asymptomatic in the majority of cases

Common symptoms at presentation (if present)

- Fatigue
- Abdominal fullness
- Weight loss/anorexia
- Bone pain
- Fever

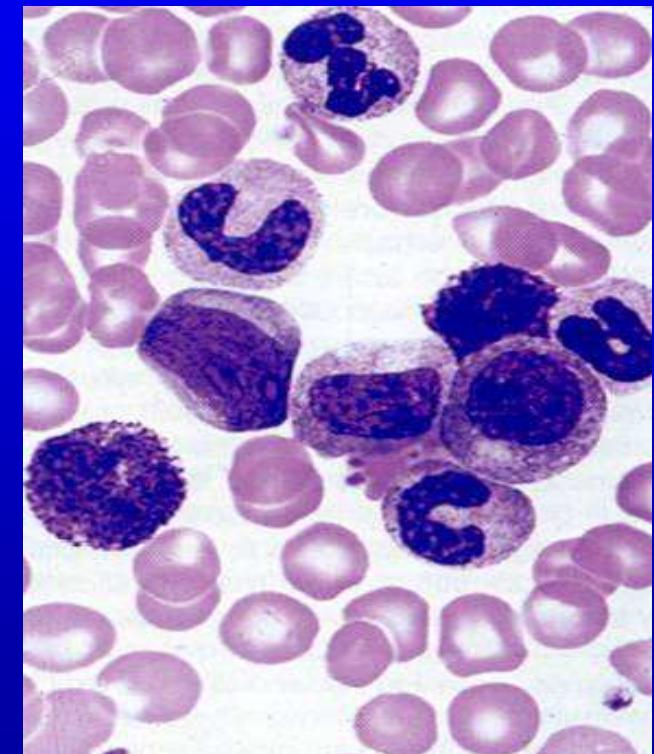

Common signs

- Palpable splenomegaly
- Palpable hepatomegaly

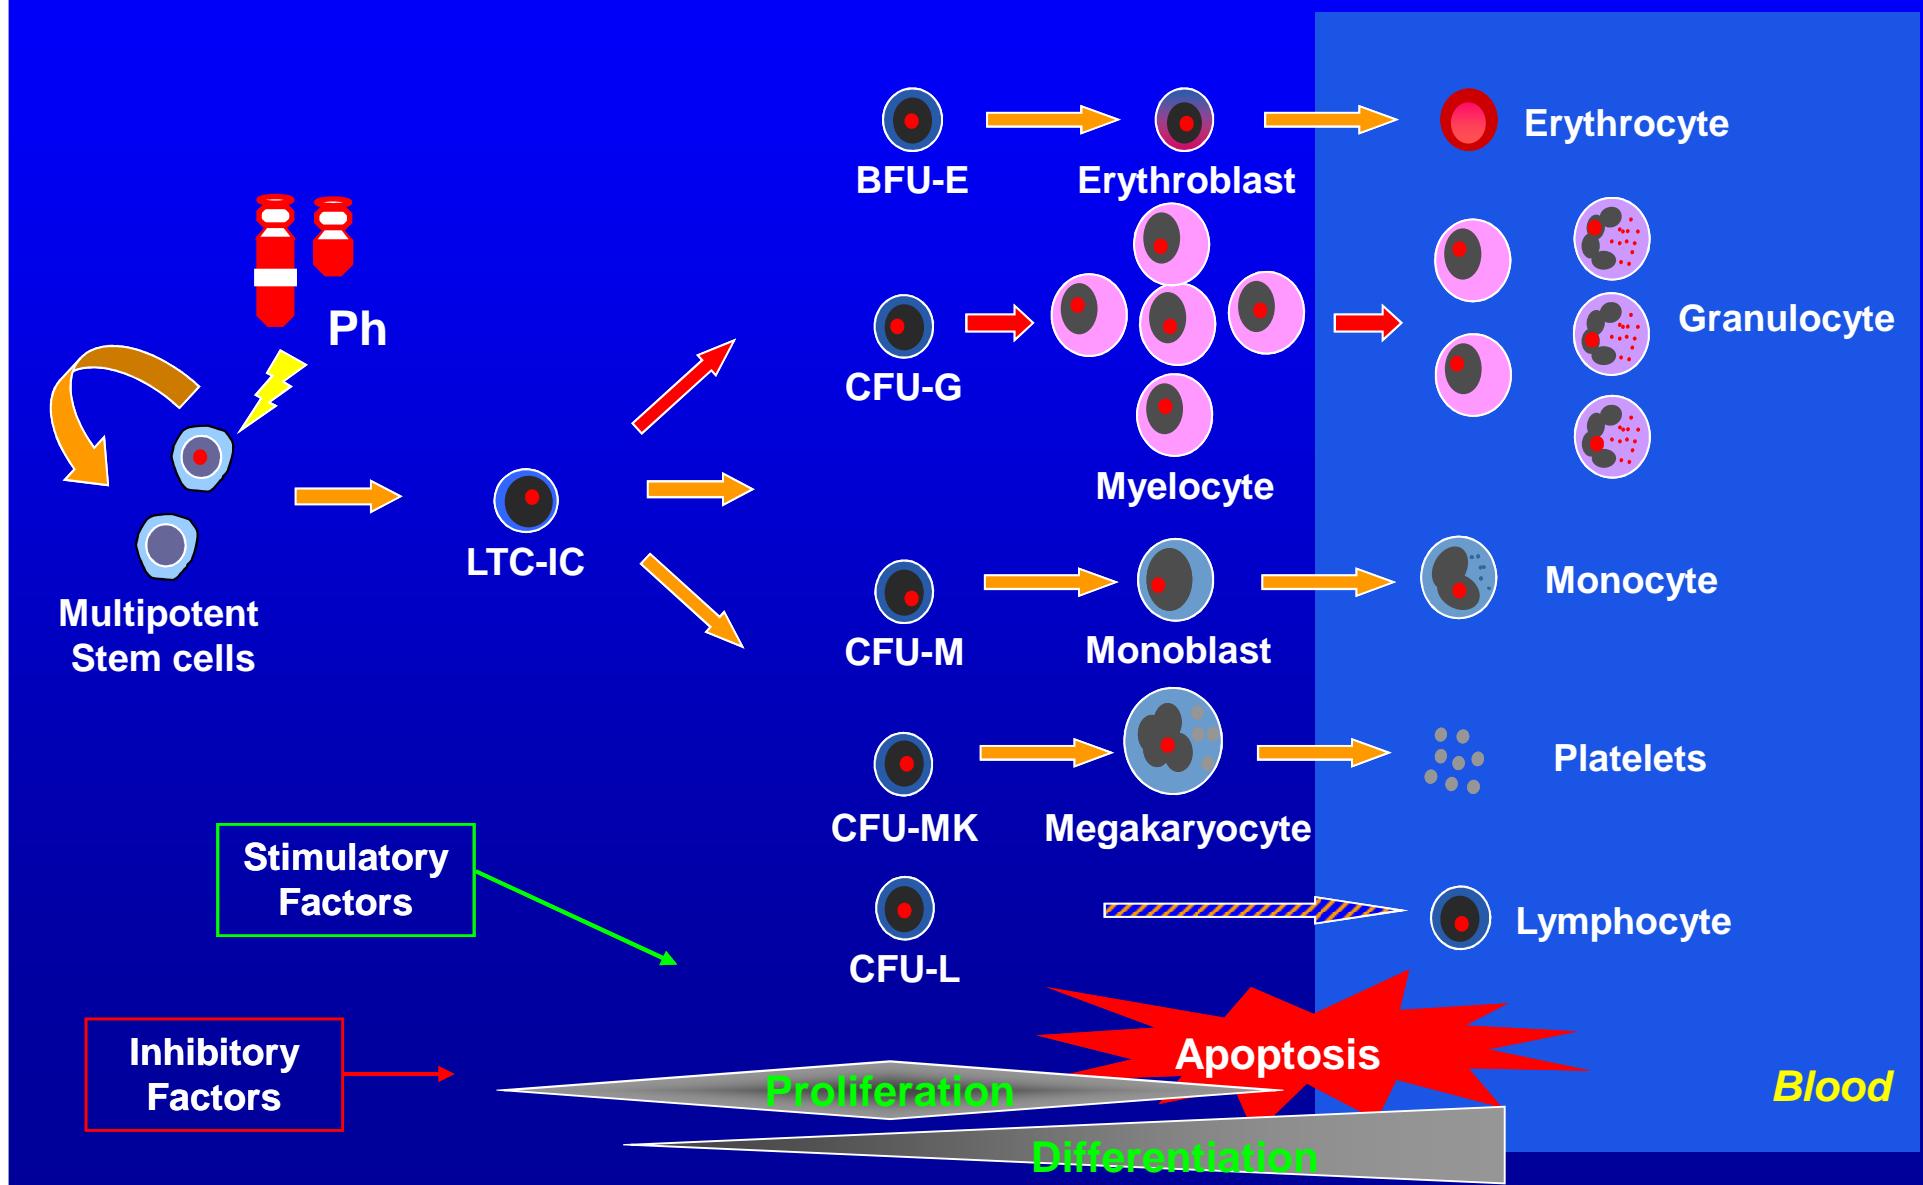

# CML - Chronic Phase

## Common laboratory findings

- Leukocytosis
  - <20.000/mm<sup>3</sup> rare
  - 20.000 – 100.000/mm<sup>3</sup> 55%
  - >100.000/mm<sup>3</sup> 45%
- Abnormal differential (myelocyte peak)
- Platelet count
  - Low 10%
  - Normal 60%
  - High 30%
- Anemia
- Basophilia

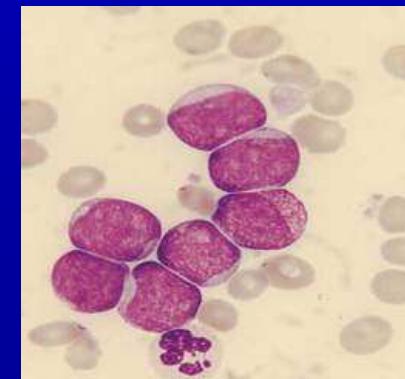

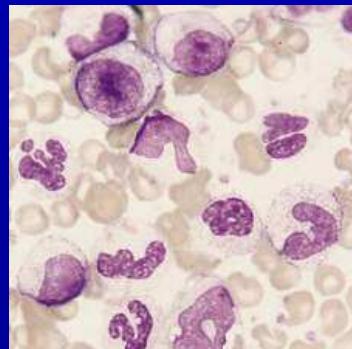

# CHRONIC MYELOID LEUKEMIA

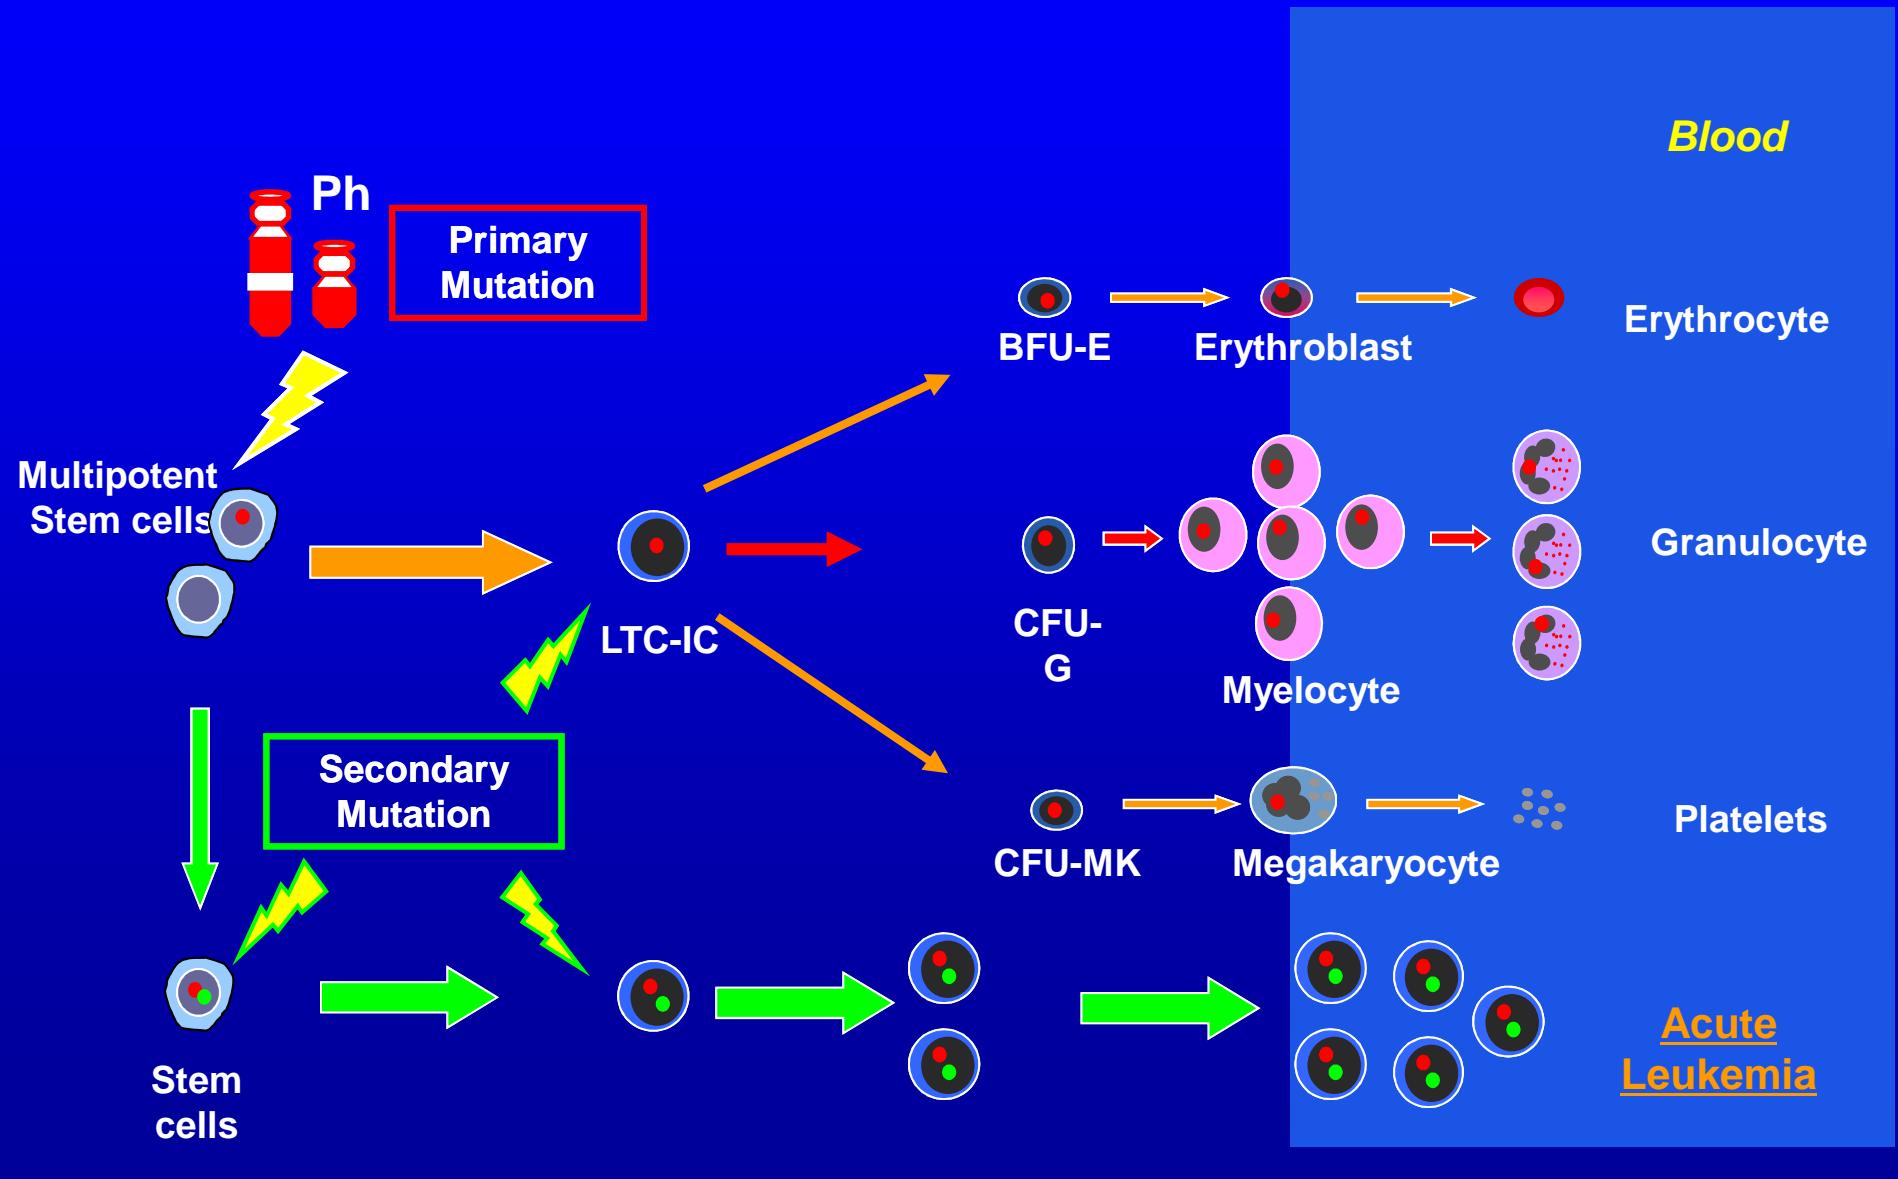

# CML - The natural history of disease IFN era (up to 2000)

Chronic Phase	Advanced Phases	
	Accelerated Phase	Blast Crisis
Median 1-10 years*	Median 6-9 months	Median survival 3-6 months

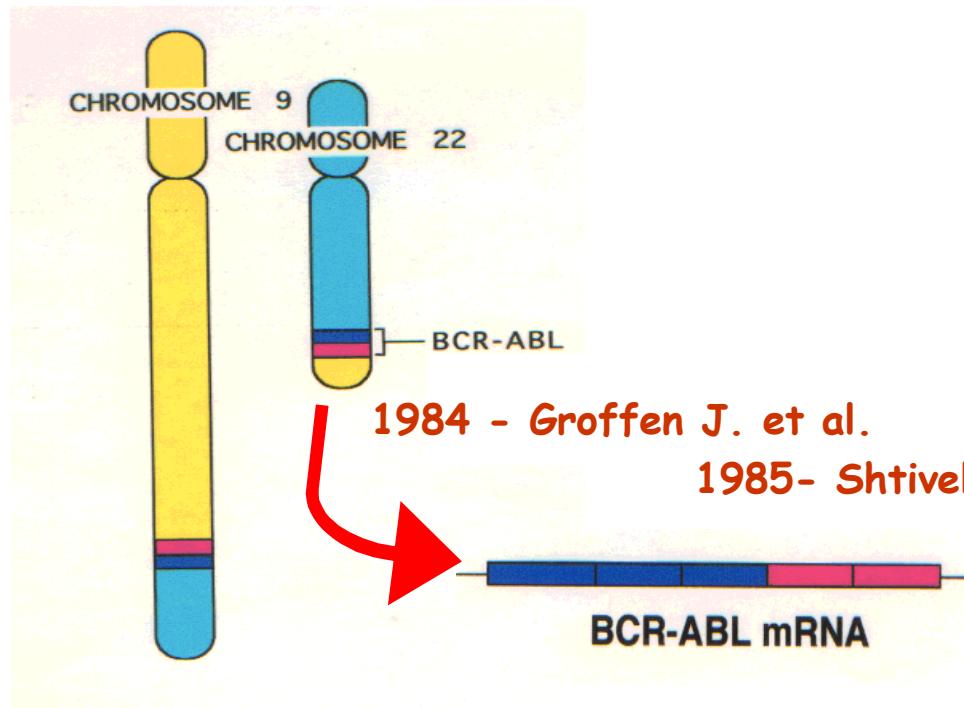

# CML CLINICAL EVOLUTION: The Blast Crisis

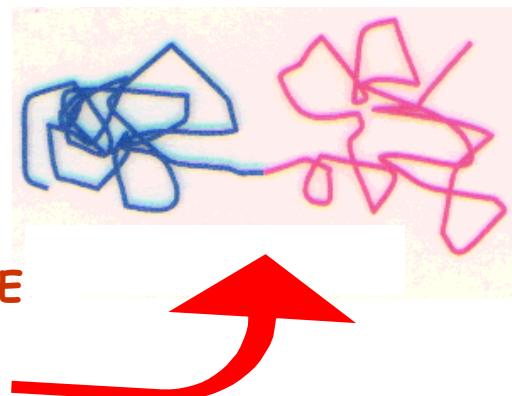

# MILESTONES IN MOLECULAR BIOLOGY OF CML

1960 - Nowell P.C. & Hungerford D.A.

1984 - Konopka J.B. et al.

Protein BCR-ABL

Consequence: new BCR-ABL fusion proteins  
with a constitutive TK activity

Activation of pathways  
sustaining abnormal  
proliferation

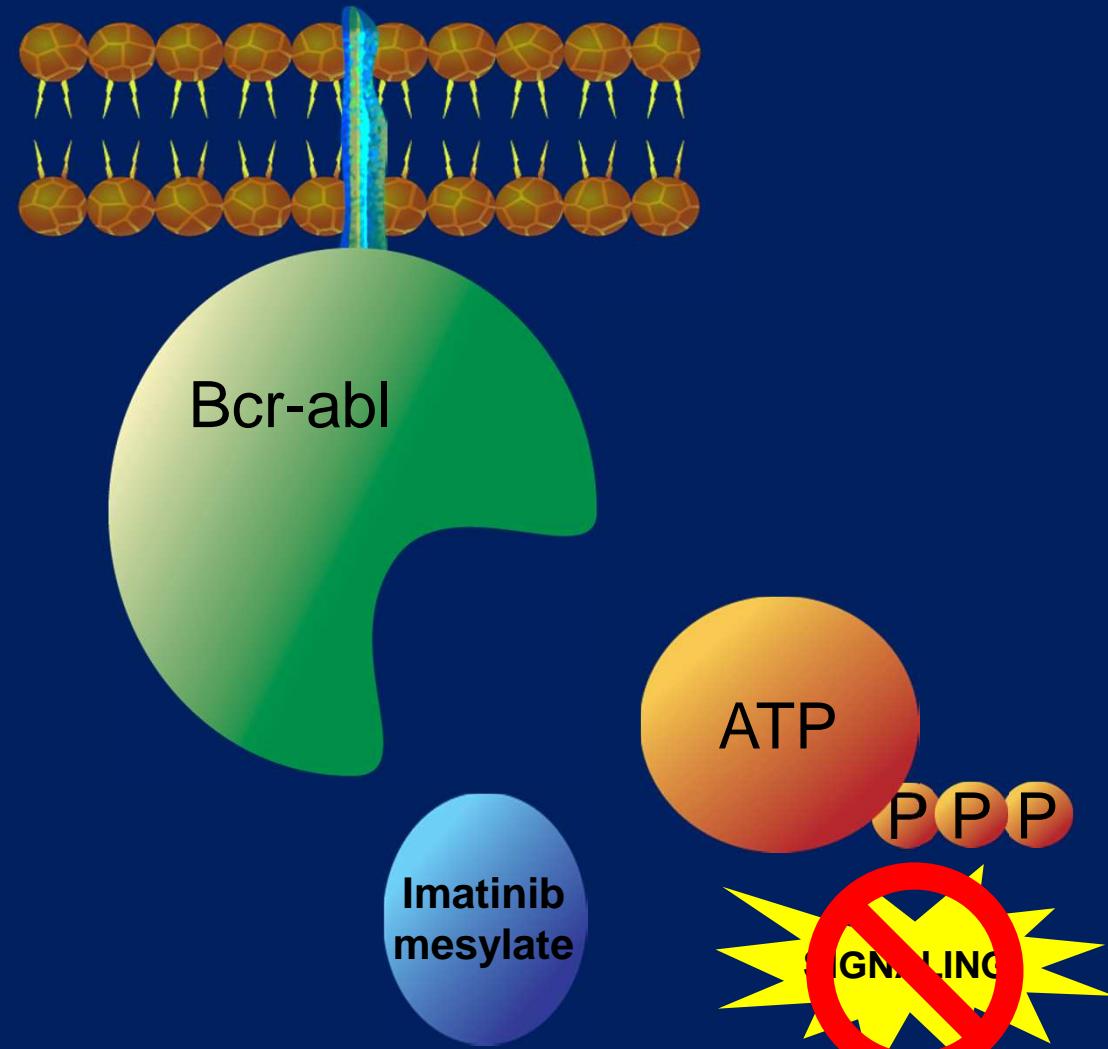

Activation of  
antiapoptotic  
pathways

**BCR-  
ABL**

Genomic  
instability

Stem cell  
maintenance

# Imatinib: il meccanismo d'azione su BCR-ABL, causa della malattia

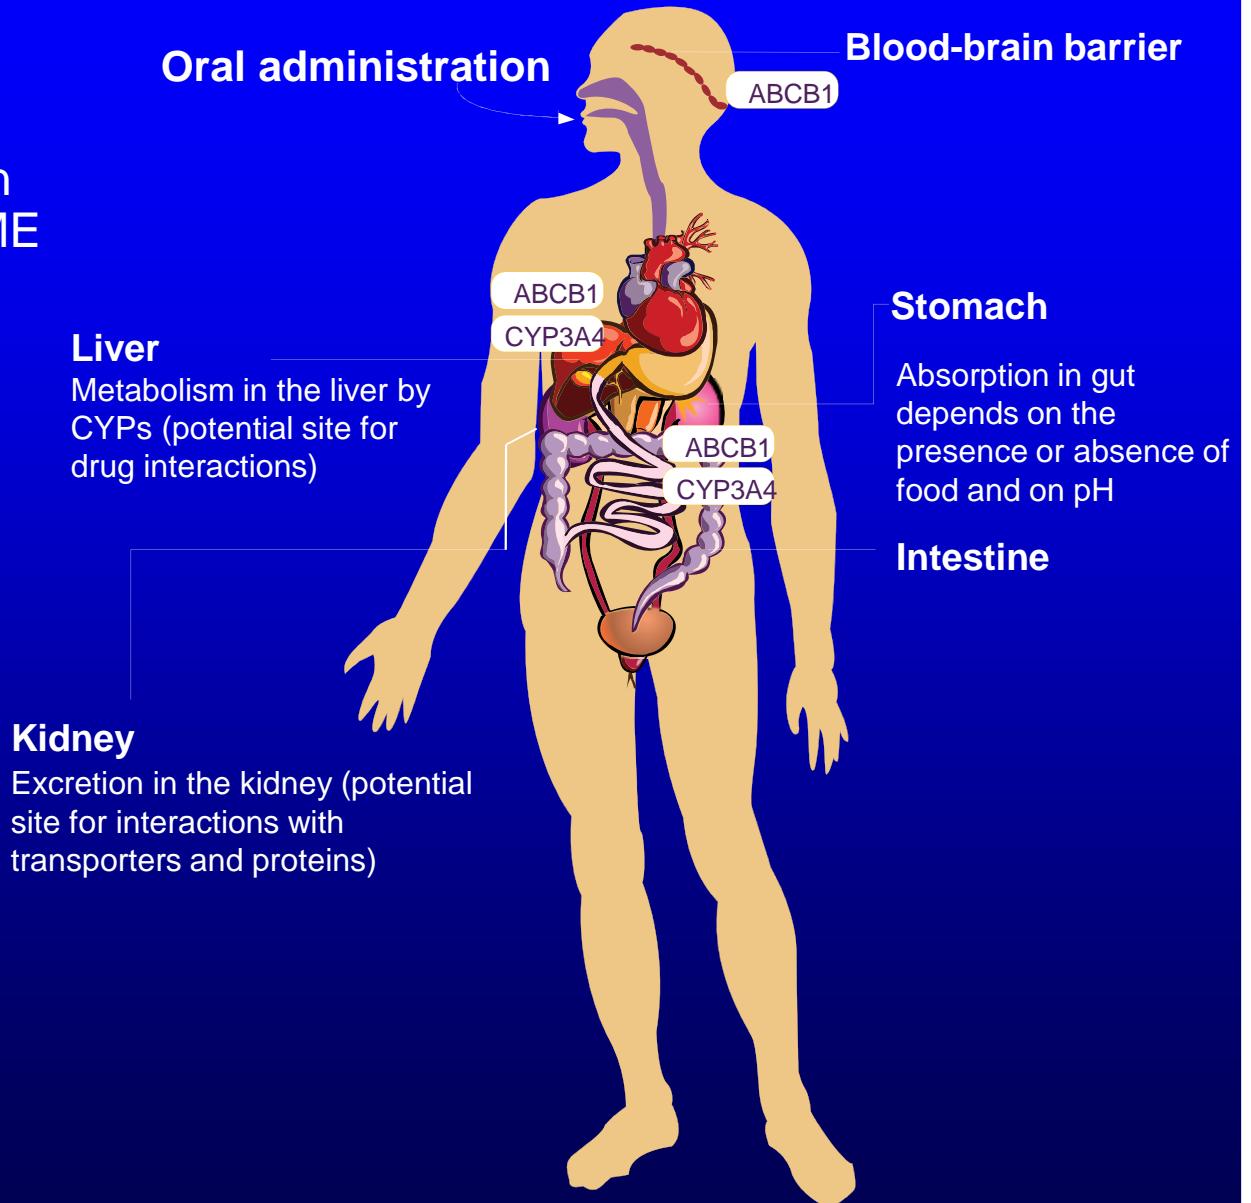

1. Savage DG et al. *N Engl J Med.* 2002;346:683-693.
2. Scheijen B et al. *Oncogene.* 2002;21:3314-3333.

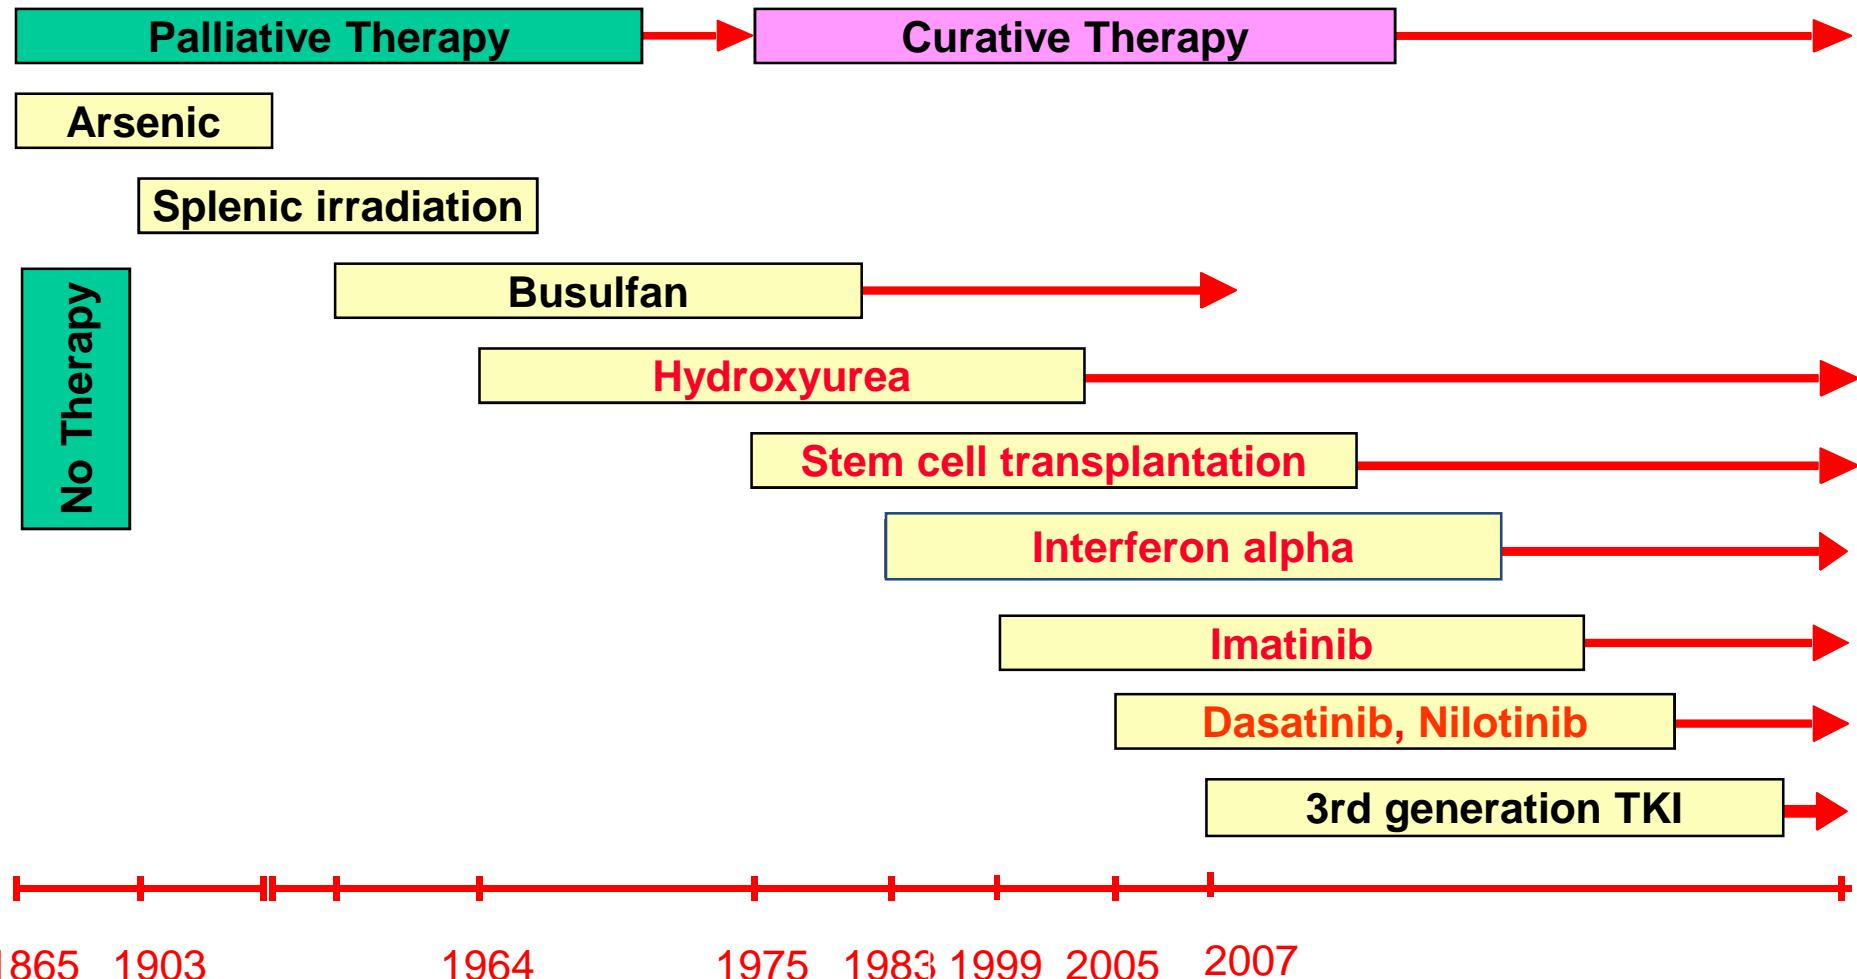

# TKIs Disposition

The life of a drug in the human body is encompassed by ADME

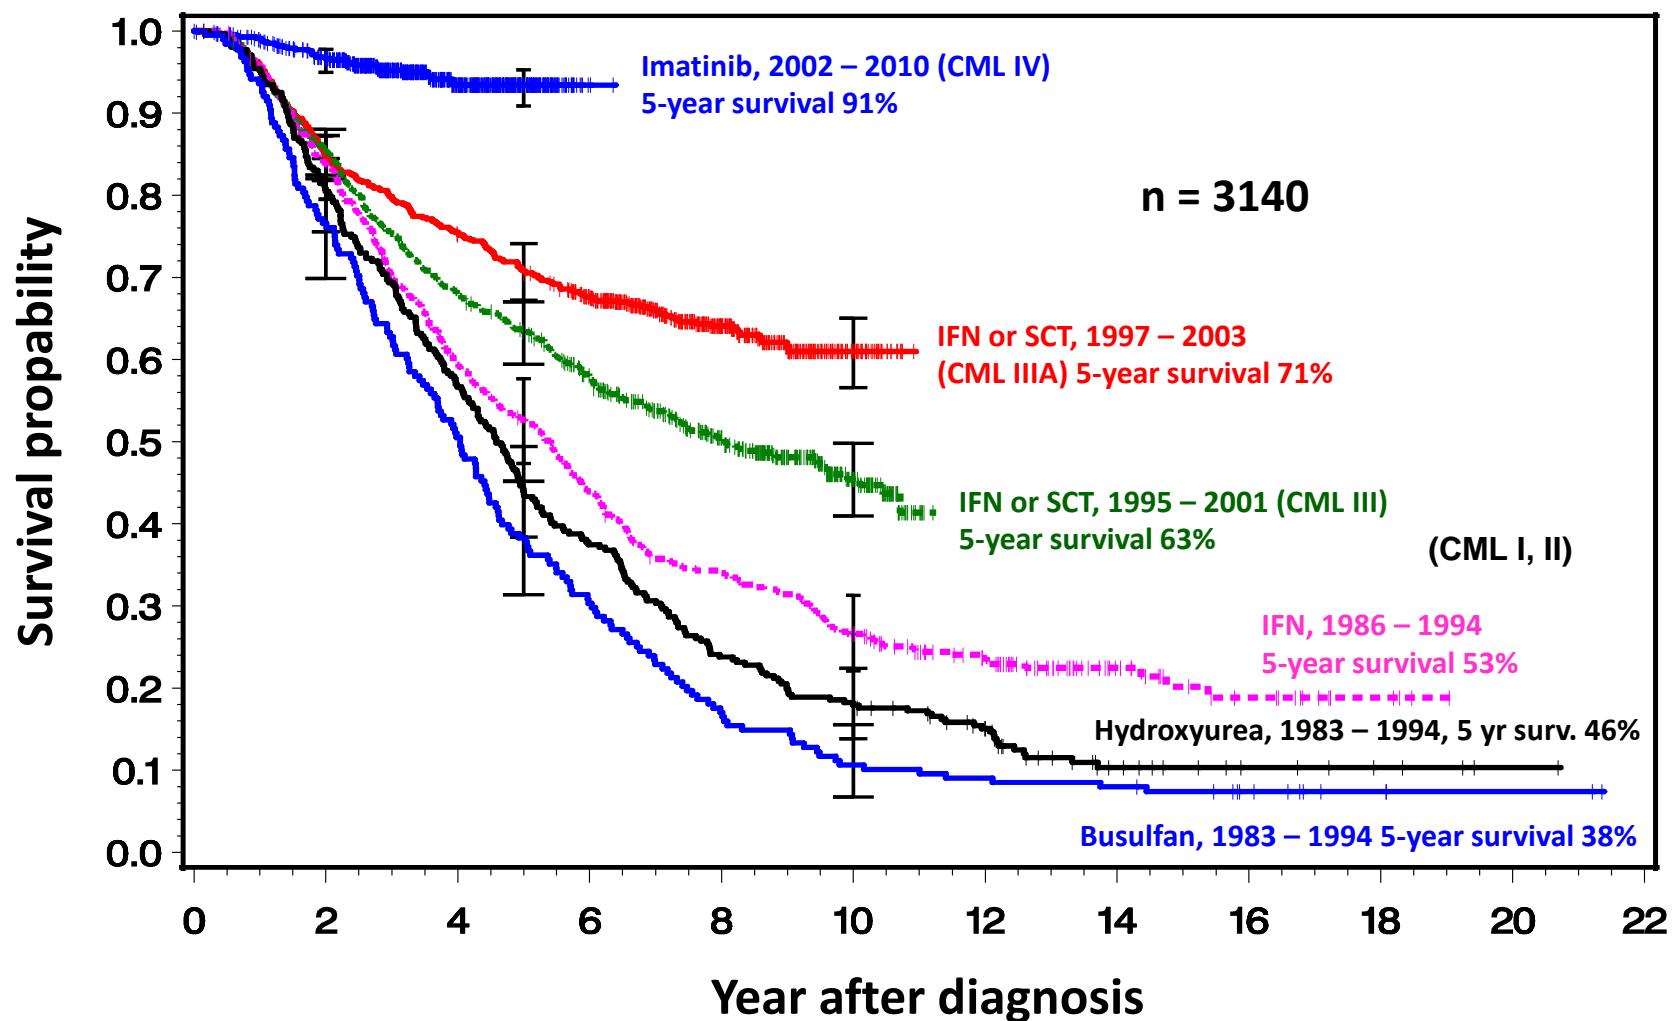

Absorption (A)  
Distribution (D)  
Metabolism (M)  
Elimination (E)

# 150 Years of CML Therapy

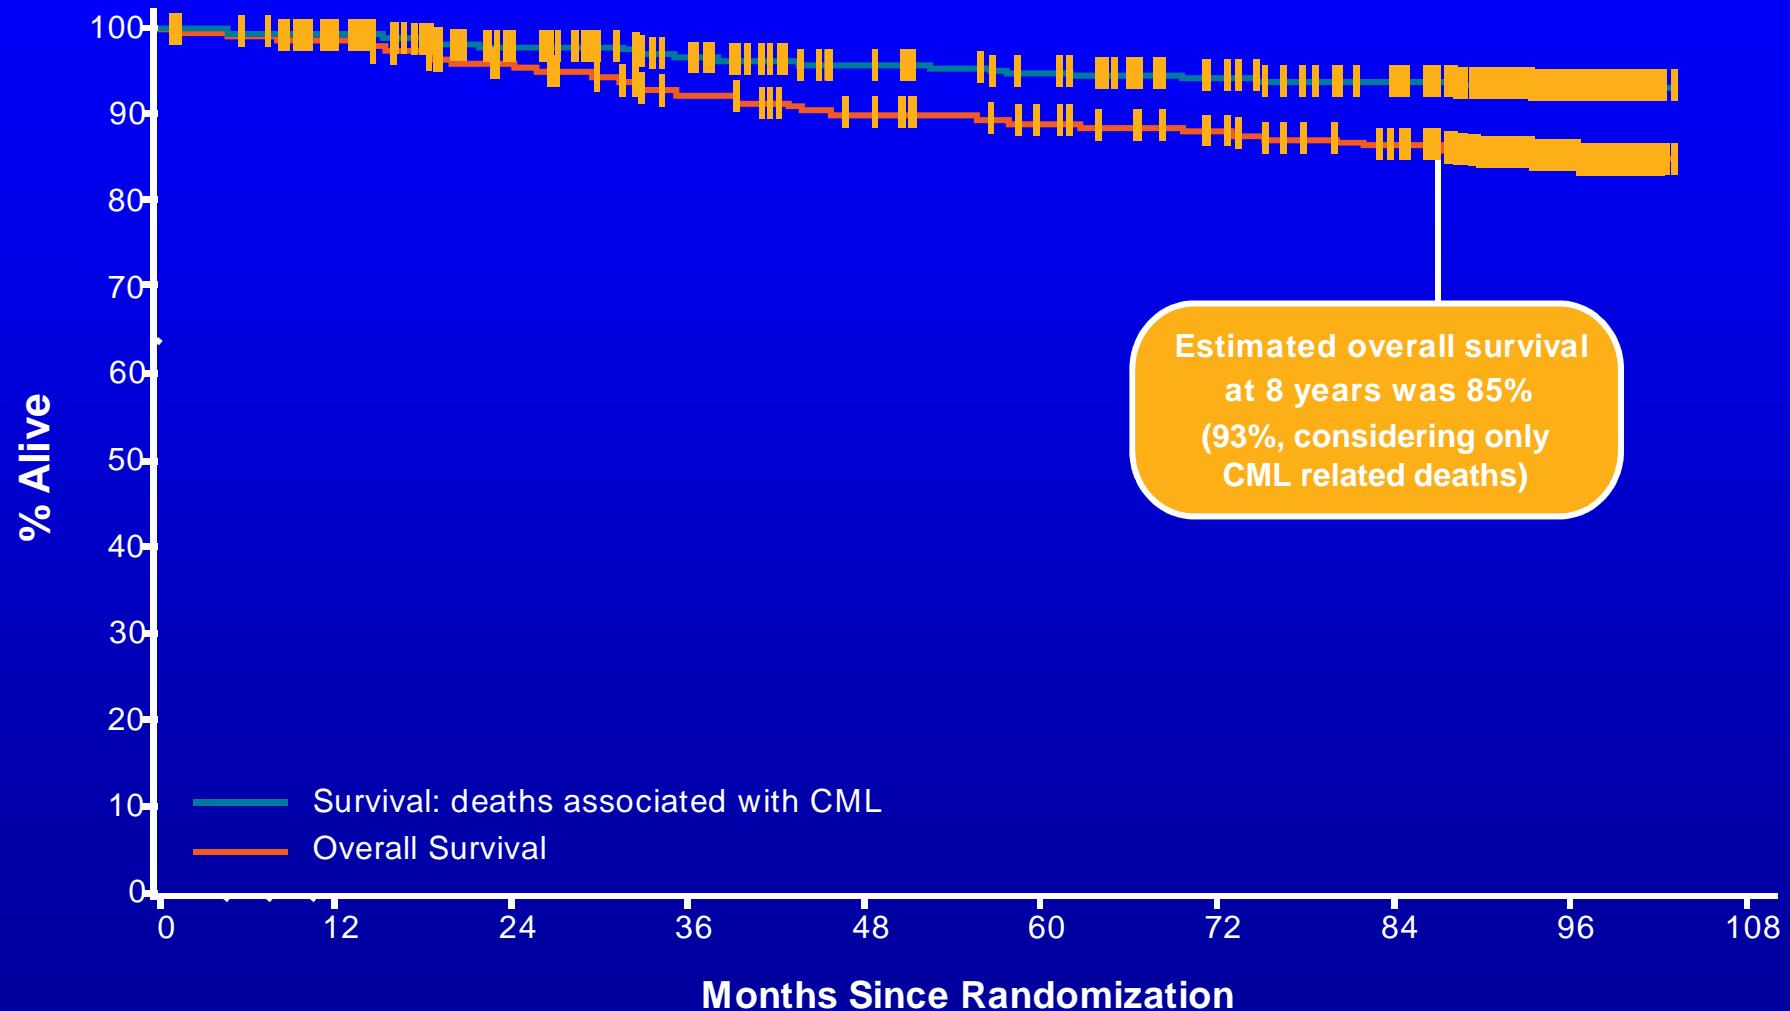

# Improvement of survival of CML 1983 – 2010

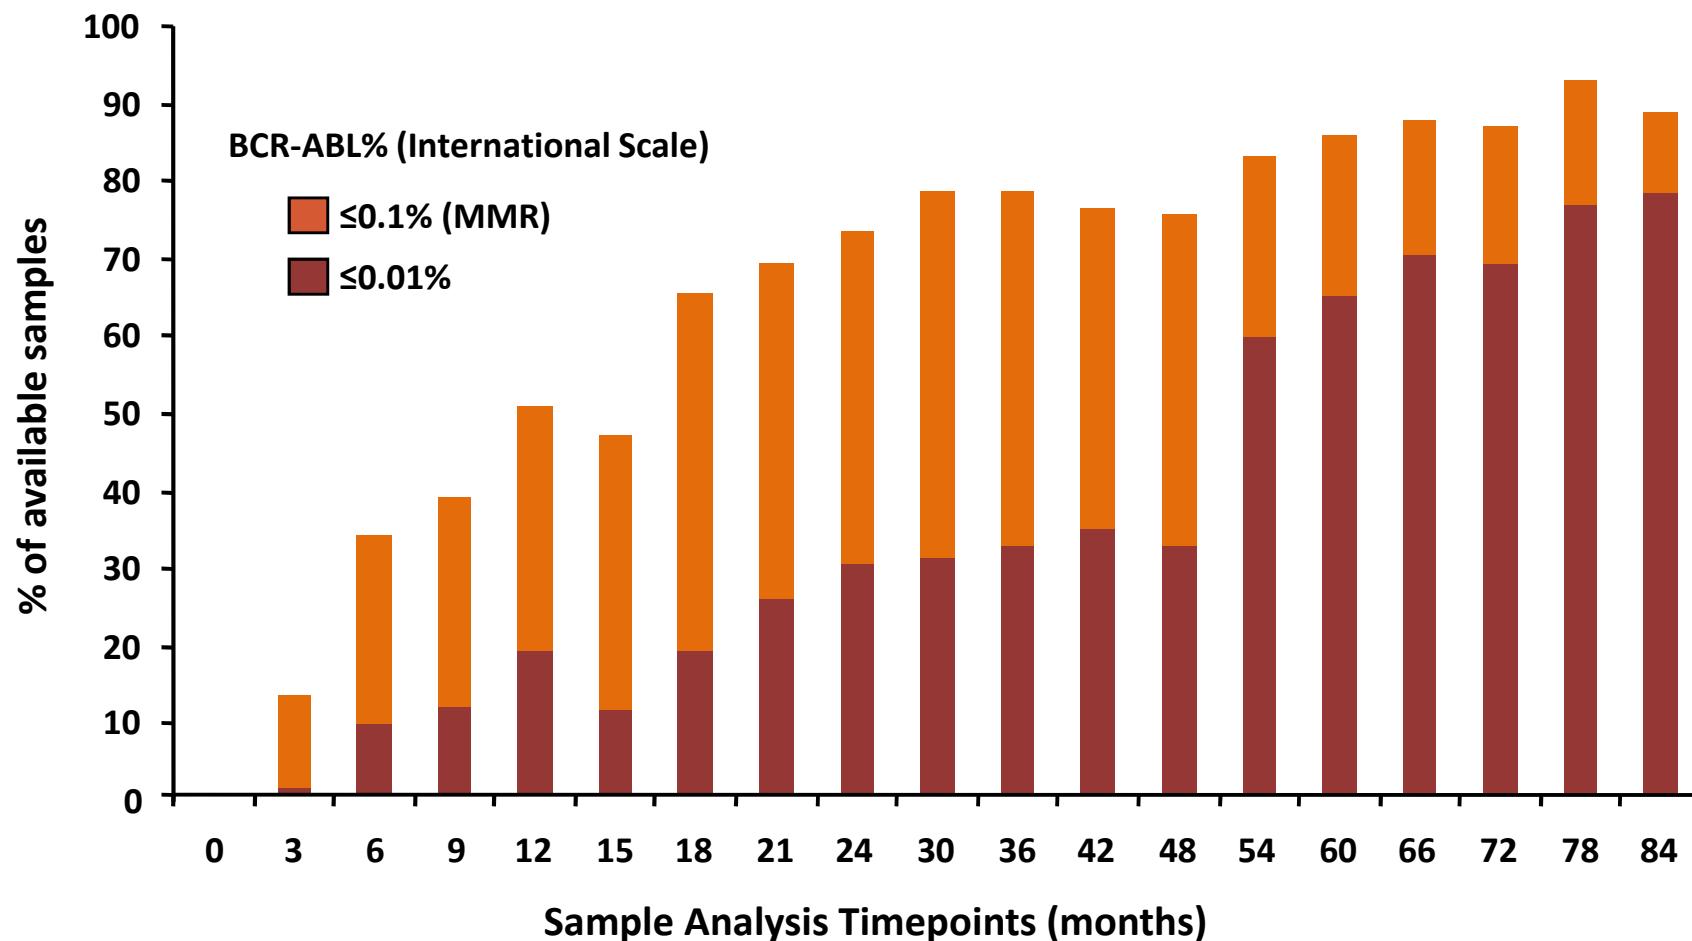

IRIS 8-Year Update

## Results: Overall Survival (Intent-to-Treat) – Imatinib Arm

# IRIS – Molecular Response Rates

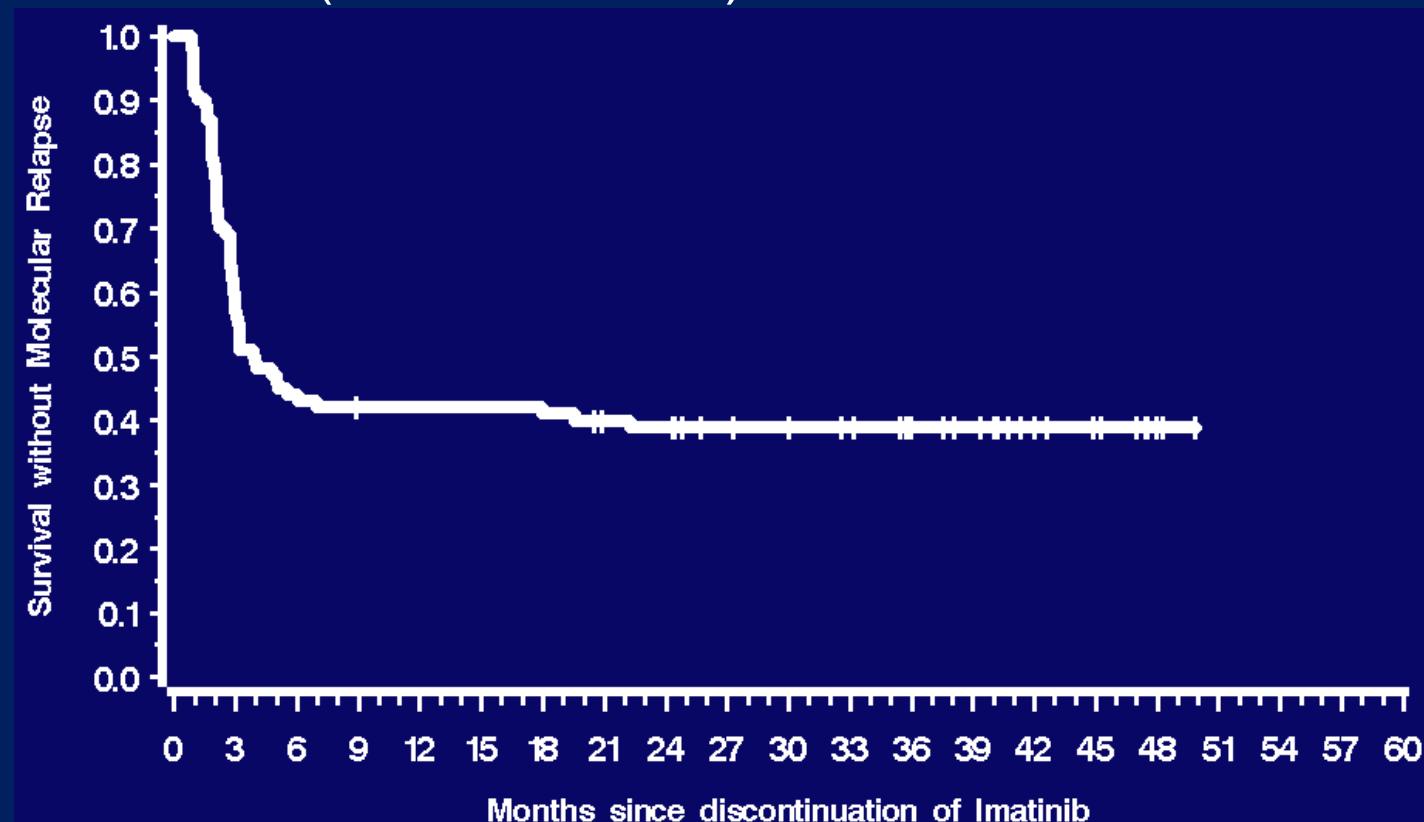

- Major molecular response (MMR) and the depth of molecular response increase over time

# Discontinuation Appears Feasible for Some Patients with CMR on TKI Therapy

Kaplan-Meier Estimates of CMR after Discontinuation of Imatinib

The overall probability of maintenance of CMR at 24 and 36 months was 39% (95% CI 29-48).

*Molecular relapse occurred in 61 pts with 58 relapses occurring during the first 7 months 3 late relapses at month 19, 20 and 22, respectively*

## La terapia con imatinib, i punti deboli:

- il 18% dei pazienti non raggiunge una risposta soddisfacente (citogenetica completa)
- 8% dei pazienti che ha raggiunto la risposta citogenetica completa la perde successivamente
- 20-25% dei pazienti sviluppa resistenza (mutazioni, evoluzione clonale...)
- 11% dei pazienti interrompe il trattamento per intolleranza per cui imatinib non è sufficiente a garantire le risposte.

# 2013 TKIs approved for CML treatment

		Date of FDA approval	
		1 <sup>st</sup>	2 <sup>nd</sup>
<b>Imatinib</b>		2002	2001
<b>Dasatinib</b>		2010	2006
<b>Nilotinib</b>		2010	2007
<b>Bosutinib</b>			2012
<b>Ponatinib</b>			2013

## Imatinib: il problema della resistenza al trattamento (II)

In caso di resistenza la struttura della proteina Bcr-Abl subisce una modifica

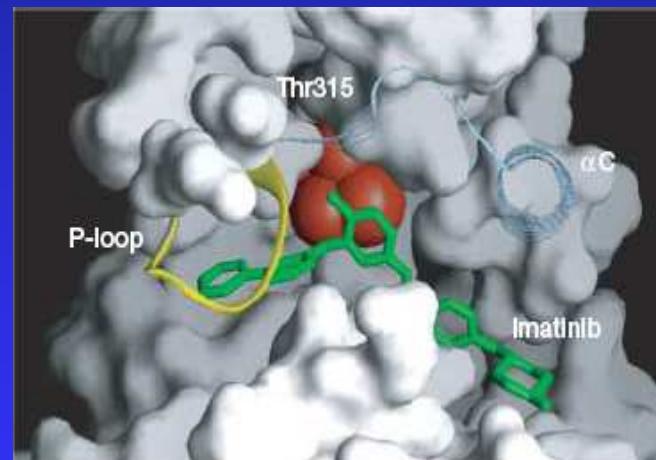

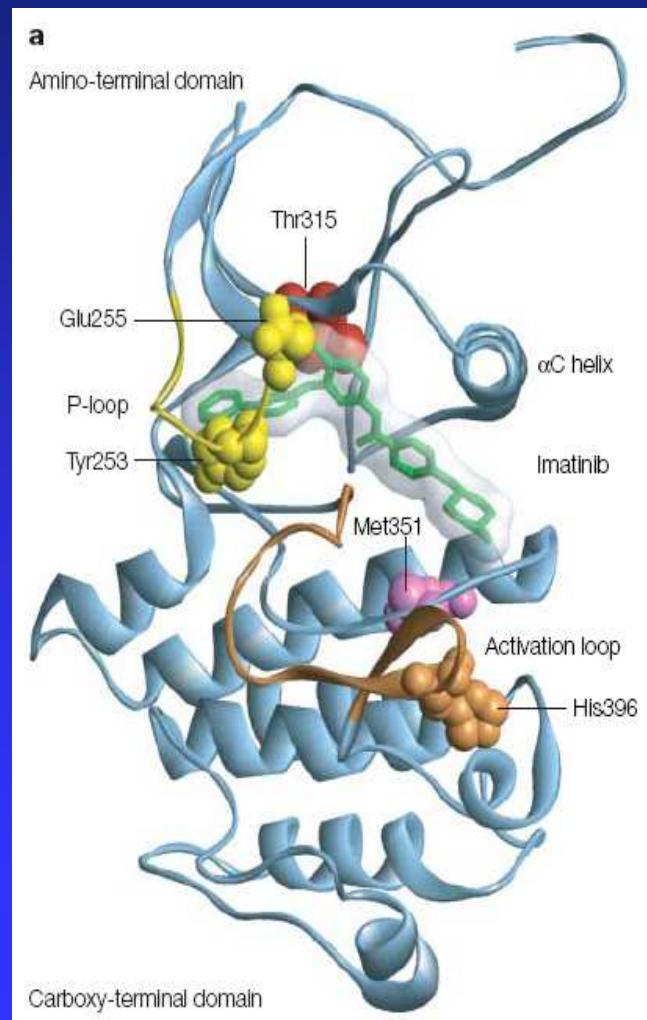

Il farmaco non riesce più a legarsi

L'attivatore si lega e attiva la cellula malata

# Imatinib interaction to the gate-closed BCR/ABL conformation

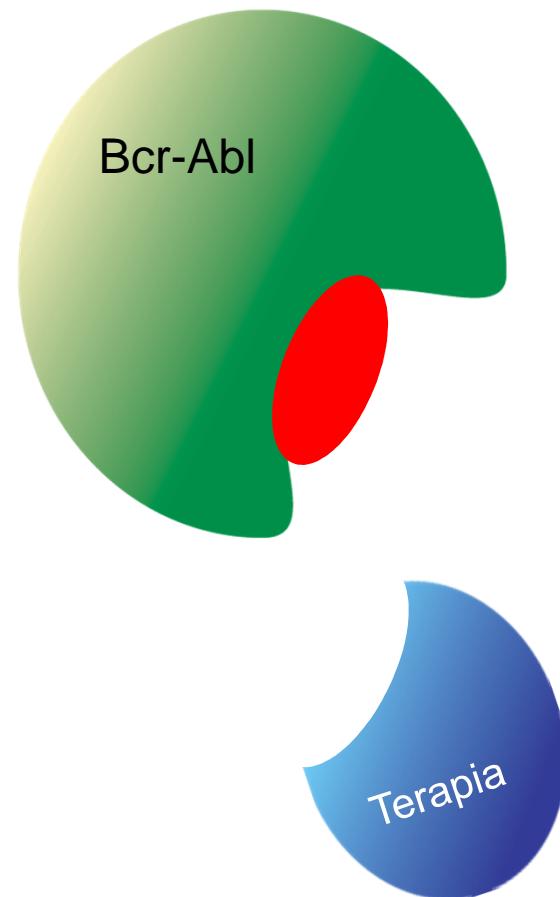

# TKI II e III generazione: il meccanismo d'azione

Nonostante la proteina  
Bcr-Abl sia modificata

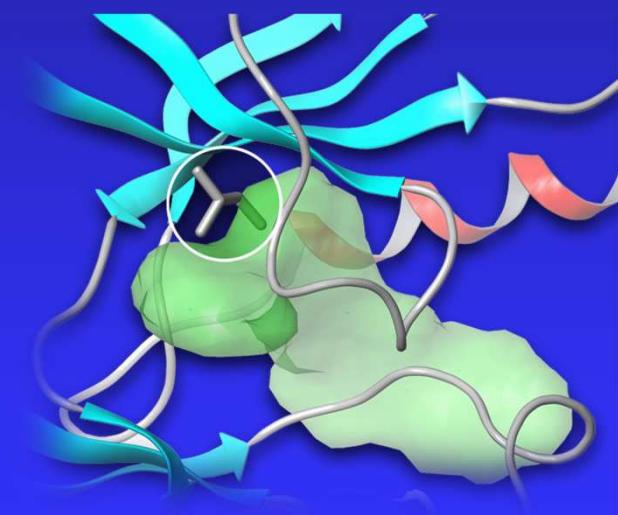

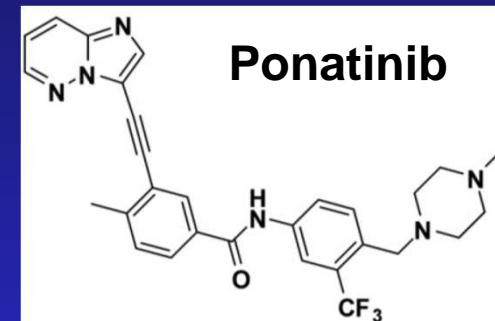

Il TKI di II e III  
generazione riesce a  
legarsi

# Ponatinib: A Pan-BCR-ABL Inhibitor

- Rationally designed inhibitor of BCR-ABL
- Active against T315I mutant
  - Unique approach to accommodating gatekeeper residue
  - Binds inactive (closed) ABL conformation
- Broad spectrum of activity against an array of BCR-ABL variants
- Multi-targeted kinase inhibitor
  - Tyrosine kinases, including VEGF, FGF, and PDGF receptors, c-KIT and SRC kinase, FLT3
- Once-daily oral activity in murine models

Ponatinib cocrystal structure  
with ABL<sup>T315I</sup>

# Treatment of CML: Perspectives

	Historical (.... – 1999)	Modern (2000 – 2010)	Future (2010-.....)
Course	Fatal	Indolent	Cure
Prognosis	Poor	Good	Excellent
Median survival (yrs)	3-6	25+ (est.)	Norm. Life span
Front line therapy	AlloSCT, IFN $\alpha$	Imatinib	Better TKIs
Second line therapy	Chemotherapy AlloSCT	new TKIs, AlloSCT	

# Cure

---

- Absence of any signs and symptoms of the disease,
- no therapy required

## Operational Cure

- Absence of symptoms, no therapy required,
- residual signs of the disease
