ESC GUIDELINES

2012 focused update of the ESC Guidelines for the management of atrial fibrillation

“The current estimate of the prevalence of atrial fibrillation (AF) in the developed world is approximately 1.5–2% of the general population, with a average age of patients in this condition steadily rising, such that it now average between 75 and 85 years”

M.L. Sacchetti

Le principali conseguenze della FA^{1,3}

- Infarto cerebrale
- Scompenso cardiaco
- Demenza

Le donne con FA corrono un rischio doppio rispetto agli uomini di avere un ictus cerebrale (3% vs 1,6%)

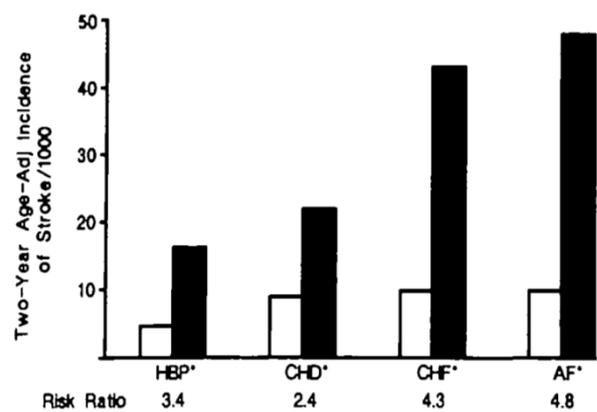

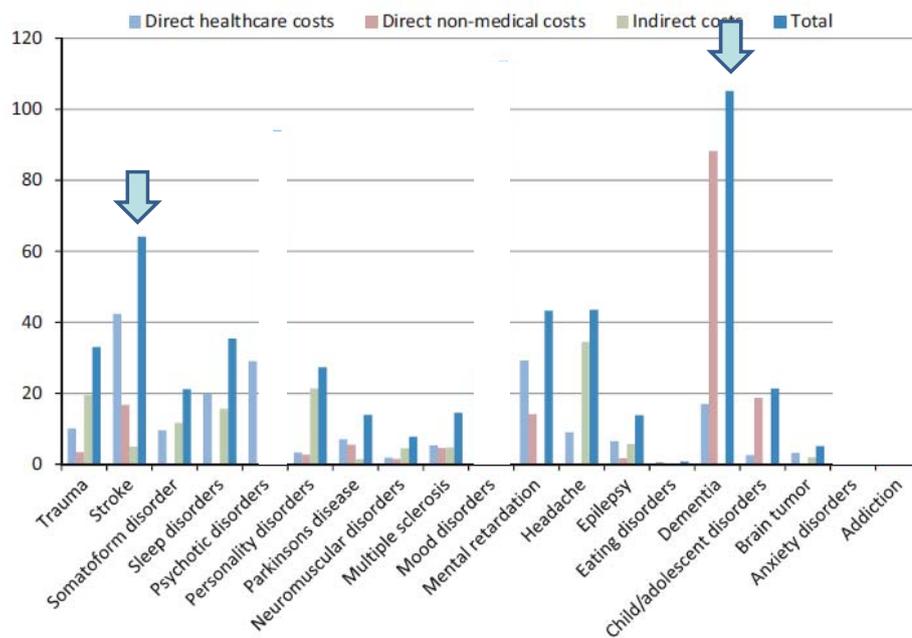

FIGURE 1. Bar graph of 2-year age-adjusted incidence of stroke according to presence (filled bars) and absence (open bars) of cardiovascular condition. HBP, hypertension; CHD, coronary heart disease; CHF, cardiac failure; AF, atrial fibrillation. * $p < 0.001$ different from unity.

Stroke Prevention: What works

Intervention	Stroke Prevention Effect
Smoking cessation	Prevents stroke by half in six months
Cretan Mediterranean Diet	Prevents stroke by 60% in 4 years
Blood pressure control	Prevents stroke by 40-50% in 2 years
Antiplatelet agents	Prevents stroke by 25-30% in 2 years
Anticoagulation for atrial fibrillation	Prevents stroke by half in a year
Lipid lowering with statins	Prevents stroke by 25-30% in 2 years
Diabetes control	Prevents stroke by 30% in 4 years
Homocysteine treatment with vitamins	Prevents stroke by 24% in 2 years
Endarterectomy for severe symptomatic carotid stenosis	Prevents stroke by 66% in 2 years

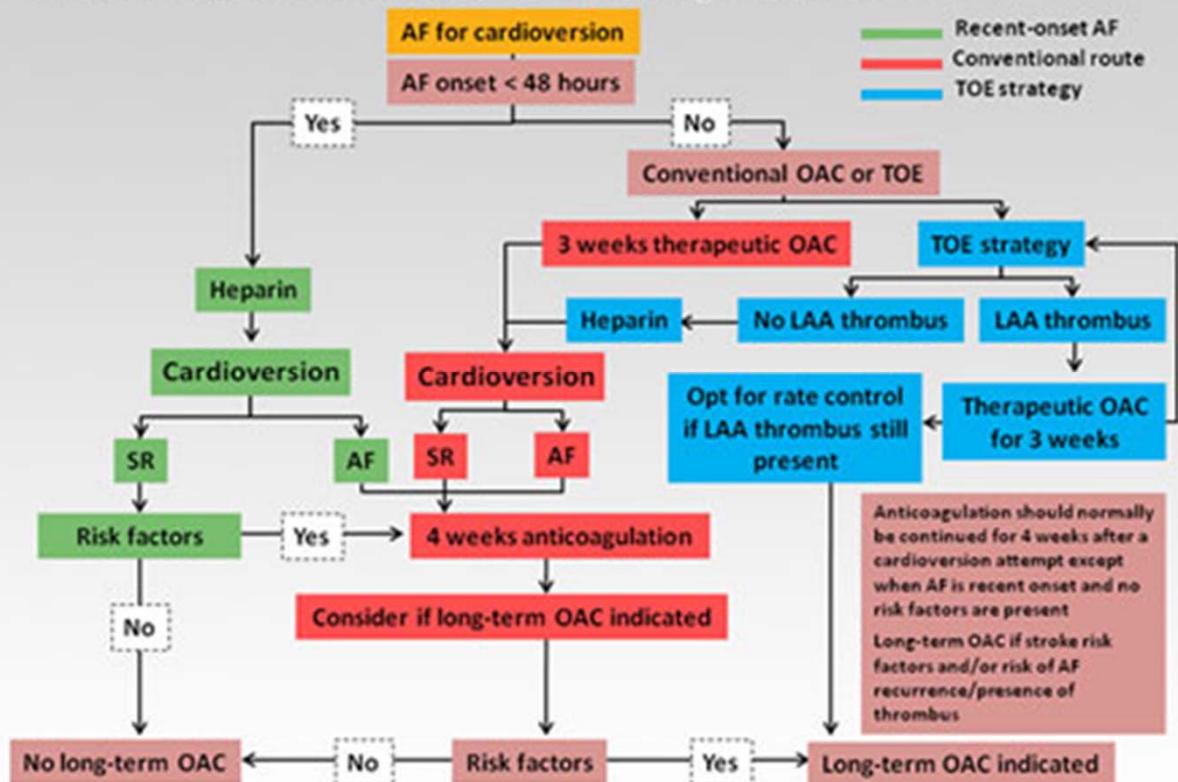

Getting it all right can reduce the risk of stroke by 80-90% in secondary prevention¹

Atrial Fibrillation Clinic with Nurse Specialists Improve Patient Outcomes

Topics: Cardiovascular Nursing
Date: 15 Apr 2011

The incidence and prevalence of atrial fibrillation (AF) is increasing as the population ages, and people live longer with conditions such as hypertension and heart disease that can lead to AF. Managing AF and ensuring appropriate evidence-based treatment, especially anti-coagulation to prevent strokes, is essential but not always consistently done despite ESC guidelines on AF.

A randomised clinical trial in the Netherlands to compare treatment in a specialised AF clinic with usual care by cardiologists was recently completed and results presented at the American College of Cardiology Congress in April. The AF clinic included nurse specialists with cardiologist supervision and guidelines-based software that provide treatment plans. The nurses were able to empower patients through spending time on patient education including diagnostic tests, treatment options, symptom management, complications and needed lifestyle changes. The nurses also coordinated care with referring practitioners. The primary endpoint was a composite of: death from cardiovascular causes and cardiovascular hospitalization for heart failure; stroke from a blocked artery to the brain (ischemic stroke); acute heart attack (myocardial infarction); systemic embolism; major bleeding; defined arrhythmic events; and life-threatening adverse effects of drugs.

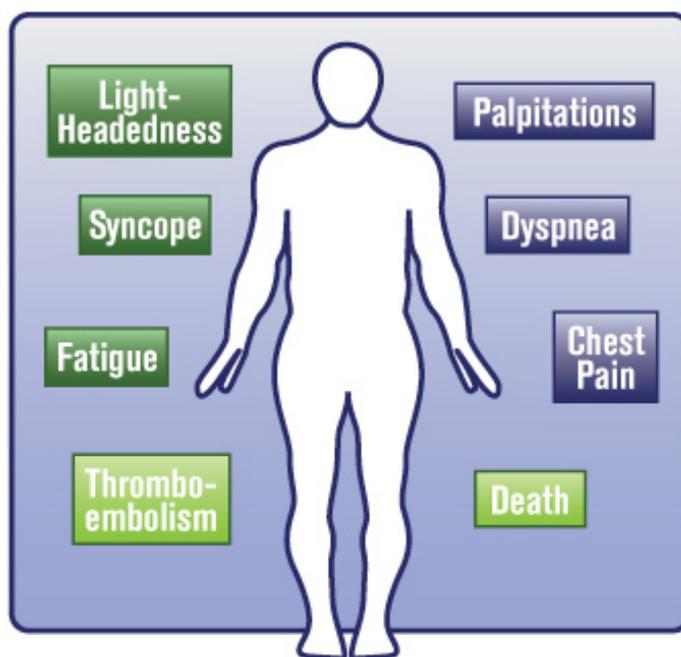

As reported in the ACC* press release, CCNAP member Jeroen Hendriks, MSc, Maastricht University Medical Centre, Maastricht, the Netherlands, an investigator and lead author for the study said: "The system guides nurses and cardiologists through the entire process of integrated chronic care to ensure they don't miss anything in diagnostics or therapeutics. The specialized AF Clinic helps in closing the gap between guideline recommendations and current clinical practice."

**The sun, the Earth, just everything,
Took six days of creation,
But then to torment mankind,
The Devil invented atrial fibrillation.**

So AF remains a puzzle,
With no easy answers today,

And if anyone can cure AF,
He really will be clever,
Because the difference between true love and AF,
Is that AF is for ever!

*Letter to the Editor***Atrial Fibrillation and the Meaning of Life**

The sun, the Earth, just everything,
Took six days of creation,
But then to torment mankind,
The Devil invented atrial fibrillation.
In the journey from cradle to grave,
Once only death and taxes were certain,
Now there's AF to entertain,
Before that final curtain.
But, there's no such thing as just AF,
The arrhythmia has many faces.
The good, the bad, the just plain ugly,
The irregular pulse that races.
In Bombay, Beirut and Baghdad,
The management is the same.
Control the rate and thin the blood,
Restoring normal rhythm is also an aim.
Choose an anticoagulant,
Once there were only a few.
Heparin, Antiplatelets and Warfarin
And now there's some that are new!
And the reason we anticoagulate,
Is to prevent embolic strife.
Whilst a bleed may ruin your day,
A stroke will ruin your life!
And in terms of rhythm control,
Just line up and take your turn,
There's a smorgasbord of options,
We can poison, shock and burn.
There are many pills to take,
With side-effects to rue.
Some cause lethargy, others Torsade,
And one even turns you blue.

But if the pills begin to fail,
And the rhythm is out of whack,
Just call the electric twiddlers,
They'll give your heart a zap.
But if they zap, then zap again,
And AF won't go away,
The twiddlers change their tactics,
They'll fight a different way.
First, EP checks the circuits,
Then, spot welding with RFA,
It's napalming the heart,
To keep a Fib at bay.
And during this you lie there,
With wires up every vein,
They turn you on, they turn you off,
While you're doped out of your brain.
So the management of AF,
Is a multidisciplinary game.
Because when all treatment fails,
There's lots of people to blame.
So AF remains a puzzle,
With no easy answers today,
Some poison, others burn,
Some patients even pray.
And if anyone can cure AF,
He really will be clever,
Because the difference between true love and AF,
Is that AF is for ever!

*Presidenza
del Consiglio dei Ministri*

CONFERENZA PERMANENTE PER I RAPPORTI
TRA LO STATO, LE REGIONI E LE PROVINCE AUTONOME
DI TRENTO E BOLZANO

Accordo, ai sensi dell'art. 4 del decreto legislativo 28 agosto 1997, n. 281, tra il Ministro della salute, le Regioni e le Province autonome di Trento e di Bolzano, concernente "linee di indirizzo per la definizione del percorso assistenziale ai pazienti con ictus cerebrale".

Rep. n. 2195 del 3. Febbraio 2005

2005

**DOCUMENTO DI INDIRIZZO PER LA DEFINIZIONE DEL
PERCORSO ASSISTENZIALE AI PAZIENTI CON ICTUS
CEREBRALE.**

Scopo del presente documento è, quindi, quello di presentare in un modo sintetico e ragionato le strategie, per trasferire nella pratica corrente gli elementi di provata efficacia oggi disponibili, allo scopo di identificare gli aspetti essenziali del percorso assistenziale al paziente con ictus, lasciando poi alle singole realtà regionali il compito di definire in modo più preciso i modelli organizzativi più confacenti al contesto locale.

- 1. Prevenzione**
- 2. Prove di efficacia per la stroke care e la trombolisi**
- 3. Percorso assistenziale (pre-ospedaliera, ospedaliera, post-ospedaliera)**
- 4. Monitoraggio dell'implementazione delle reti stroke (AUDIT)**

M.L. Sacchetti

Organizzazione dell'assistenza all'ictus:
le Stroke Unit

TAKE HOME MESSAGES

Secondo i dati dello studio PROSIT riferiti a un'indagine sui 677 ospedali che ricoverano almeno 50 ictus per anno, meno del 10% degli ospedali è dotato di una Stroke Unit (SU). La maggior parte (il 75%) delle SU è in ambito neurologico. L'attuale offerta assistenziale all'ictus acuto è dunque inadeguata e assolutamente basso è il numero dei pazienti con ictus ischemico che hanno accesso alla terapia trombolitica. È possibile migliorare la qualità dell'assistenza all'ictus con beneficio per i pazienti in termini di ridotta mortalità e disabilità e conseguentemente anche minori costi assistenziali e sociali nel lungo termine. Il miglioramento del processo assistenziale comporta inoltre una riduzione delle giornate di degenza e conseguentemente un risparmio in termini di posti letto. Con una degenza media di 8,4 giorni in SU, rispetto alla degenza media nazionale di 12,2 giorni per 129.200 ictus nel 2005 o di 10,4 giorni per 113.288 ictus nel 2008 (questi ultimi dati sono preliminari), si potrebbero risparmiare tra i 1512 e i 621 letti.

Il fabbisogno, su una popolazione di 57.500.000, corrisponde a circa 50 letti per milione di abitanti, in linea con quanto viene generalmente previsto nelle linee guida. L'obiettivo a lungo termine è quindi di sei SU di otto letti tra il e III livello per milione di abitanti. L'obiettivo a medio termine è la realizzazione almeno del 50% di SU di II e III livello, con la transitoria permanenza di SU di I livello che dovranno gradualmente acquisire il livello superiore. Questo può essere realizzato attraverso la riorganizzazione delle risorse sanitarie già impegnate nell'assistenza all'ictus acuto, a partire dalle UO di Neurologia, e attraverso la realizzazione di percorsi assistenziali e riabilitativi integrati.
